

35. CONCATING AND FORMING THE SEMANTIC CONTENTS

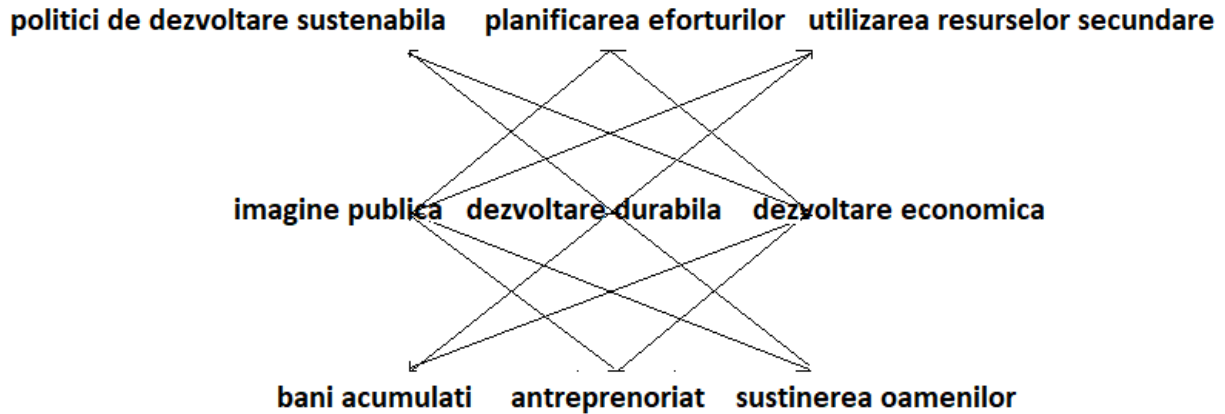

The concatenation of information from cycles can be done when the concatenation buttons have the same content. An exemplary example is below:

Following the meanings of the arrows and the items on the sustainable hexagons, we can understand the routes given by concatenations.

In the first case, when concatenating on a single button, the accumulated money being the concatenation button, we have multiple scenarios, one being presented in the figure above.

In the second case with the concatenation on two buttons we have the combination of entrepreneurship and accumulated money. We will also have multiple scenarios, but in smaller numbers than in the first case. We can understand, analyzing the logic, the need for risks and the speculative capital that are generated at the concatenation on two buttons, many of the possible scenarios being negative or disastrous.

The concatenation process can reveal the various situations, allowing them to be analyzed and contributing to finding the optimal situation. The process is part of other aspects of the art of analyzing and thinking.

The three-button concatenation represents the way in which coherent work teams, stable families, sustainable and durable businesses, lifelong relationships, or large-scale, complex but resistant and non-invasive environmental developments are carried out automatically.

The concatenation with three buttons allows the continuity of the coherent programs at higher levels, if they do not suffer from internal contradictions. This property allows complex packing of information at different levels of complexity, going below the quantum level of simple feedback and going up to the complex information packages of the multiverse.
