

52.BASIC EDUCATION PLAN

The education of generations seems like a utopia, yet modern technology allows this objective to be achieved in several stages

- a) understanding of the sustainability scheme and the gender model
- b) within the model of the fractalisation of sustainability and the passage on layer 2
- c) at the top of the connections to a model of sustainability and a model of cooperation of the layer 1
- d) at the top of their rectangular diagram of the sustainability model
- e) within the model of metabolism that appeared implicitly in layer 2 and training within the delegations regarding sustainability and metabolism
- f) at the top of the initiatory batteries and determining their own road with their own decision-making responsibilities

The number of initiation stages is much higher than the ones presented here, they can be started with practical applications and games, which corresponds to the current dependencies of children and young people. Unlike current games, they will be intended for intellectual development oriented to complexity and recovery of the sustainability and durability of natural and social environments. The system is designed so that each person can evolve on a personalized route preferably corresponding with their own psychological abilities and characteristics and with the evolutionary adaptive necessity situation.

All the ethical conditions as well as the wisdom accumulated over time can become compulsory nodes for self-evaluation of progress, mental and emotional balance as well as the efficiency or other characteristics that can be targeted within the educational system. The development on algebraic fractals and on the coherent space of the information allows the creation of specialized profiles corresponding to the needs and potentials. The system is designed so as to lead by use to the emancipation of personality, the development and recovery of

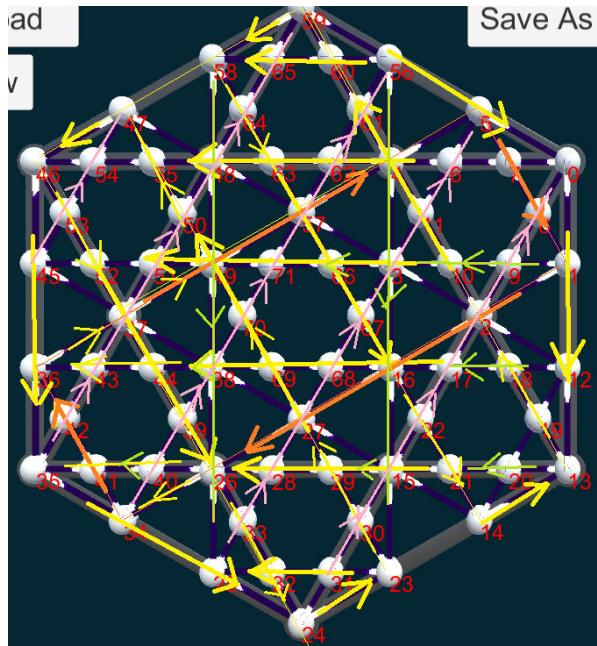

positive mental potentials, collaborative behavior, speed and depth of thinking, etc. Given the conceptual and applicative universality of algebraic fractals, new technologies based on this theoretical support will be able to lead revolutionary applications, one of these applications will be the communication with different other species and the conscious collaboration with them in solving the problem of existential balance and the sustainability of the natural environment. Another application will be the creation of the zero ecological footprint with the elimination of noxious of any kind and with the restoration of the ecosystem.

Emancipatory education should open your horizons of knowledge and give you thinking tools that transcend the fields of study and knowledge.

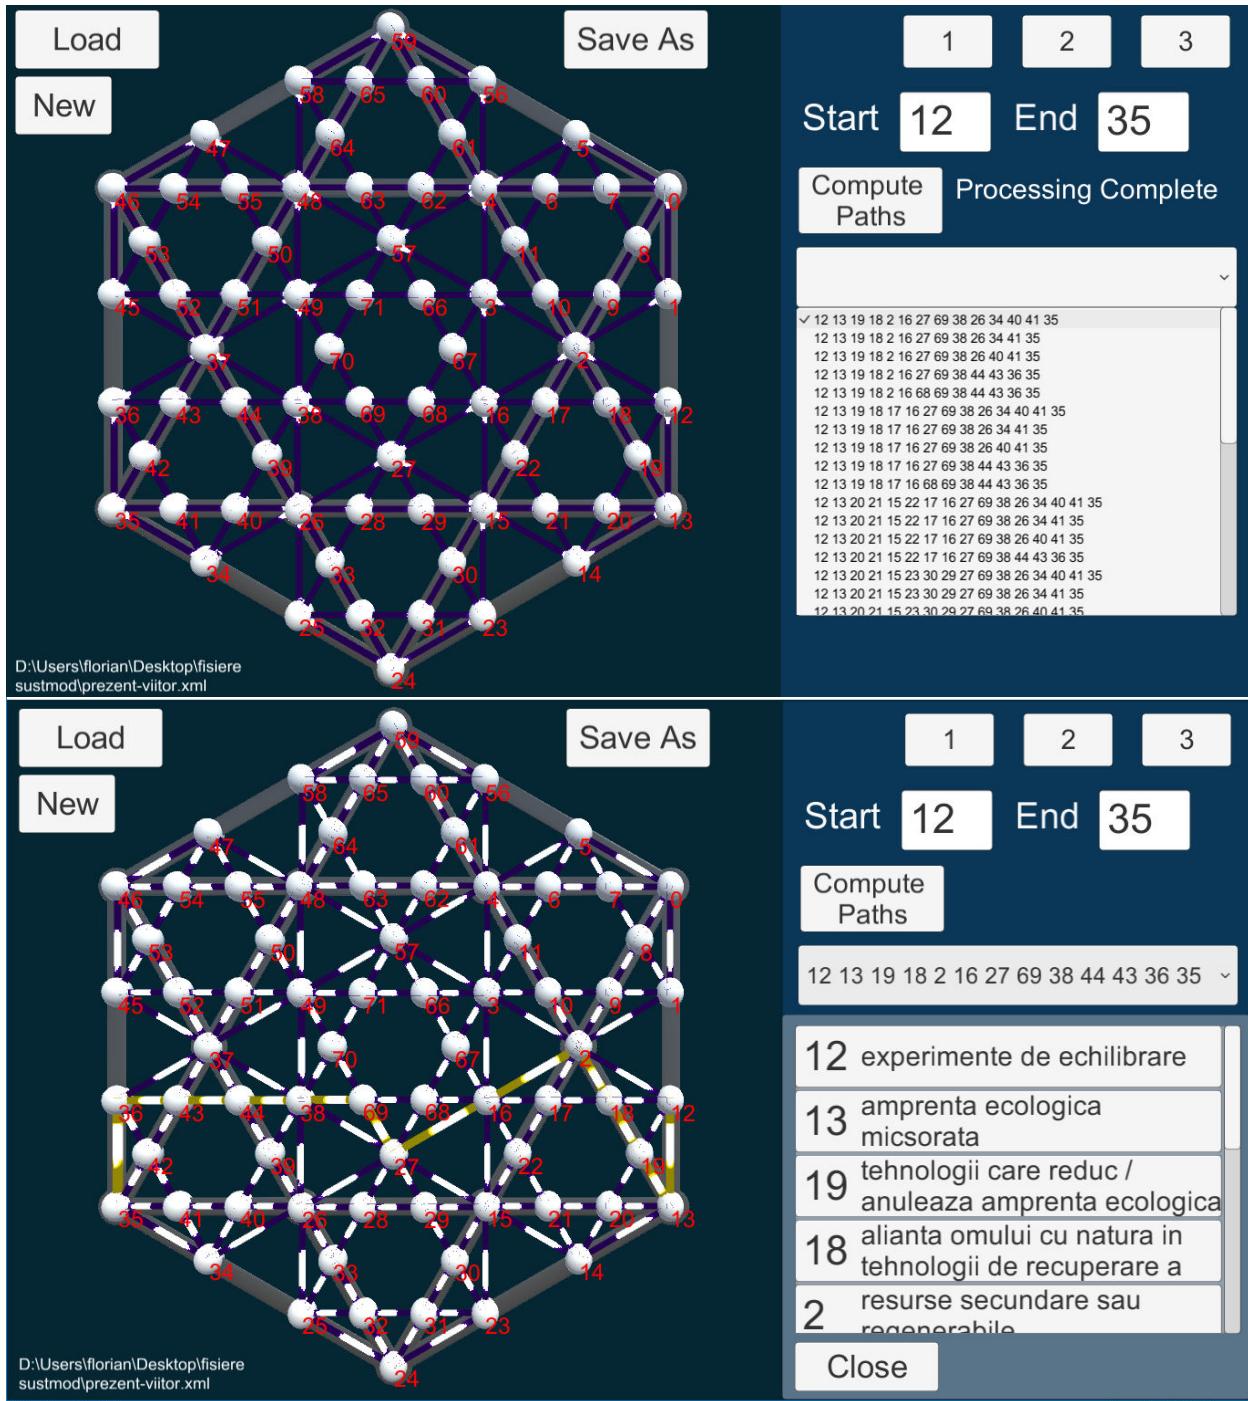

It also has to make you aware of the universe and the role of man on the land he lives and exploits, leading to the destruction of balance.

The emancipatory education can be done with the help of coherent and individualized routes of exploration and information of the students. These roads will be designed on a sustainable level 2 structure, starting from the informational vectors.

General rectangular circuits of different sizes and placements will ensure the dissemination of major ideas and principles that transcend thinking systems. The commutative diagrams will allow the accumulation of significant knowledge on the nodes with the role of data libraries.

The information in the nodes will allow the fluid transition on the students' desire of understanding on their own interest and style of learning through initiatory paths that will bring them the information they want. The initiatory paths will be multiple and according to the wishes of the students of knowledge.

Each chapter will contain information that can be differentiated by moving to a more refined granulation level.
The most important applications of the system will be the development of thinking, observation, collaboration, pattern identification, understanding of the connections and effects generated by some causes.

Other applications will be the development of professional skills and the emancipation of personality traits.

The coherent space of information will solve many of the current obstacles in education.
