

2. GENERATING OF SIMPLE FRACTOLONS

Simple fractolons are generated according to some algorithms as follows:

-step 1 the two triangles in the hexagon appear; the red “nature” and

the green “nurture” Fig 1

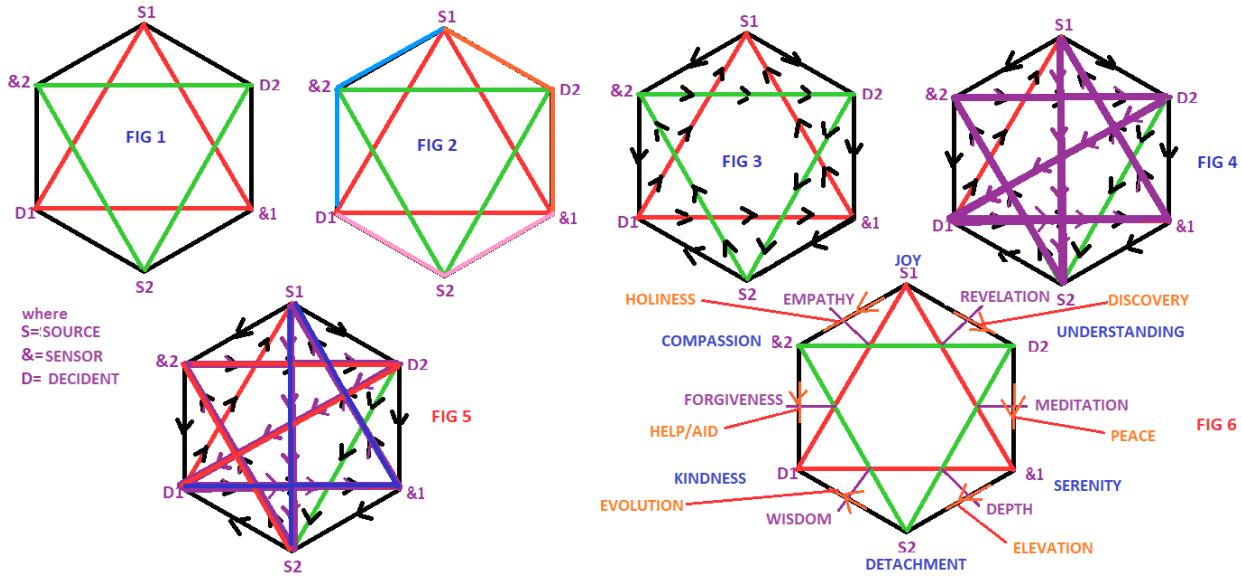

-step 2 the content of the peaks is fixed on the principle that two peaks generate the third from a semantically point of view. Thus D2 is generated by S1 and &1, S2 is generated by D1 and &1, and &2 is generated by D1 and S1. Automatically it will be obtained that S1 will be generated by &2 and D2, &1 will be generated by D2 and S2, and D1 will be generated by &2 and S2 (Fig 2);

-step 3 fixes the vectors orienting information according to figure 3, so that each large cycle is bordered by three commutative diagrams and each commutative diagram is bordered by three cycles (Fig 3);

-step 4 draws the feedback on the unicursal diagram generated by the existing vectors completed with two diagonals of the hexagon;

-step 5 identifies the two semi feedbacks, the red one and the green one (Fig 5);

-step 6 fixes the semantic content on both nodes and vectors on the principle that two contents generate on the third;

-step 7 completing the meaning of the vectors generated by nodes according to their orientation (Fig 7);

-step 8 adding and tracking the meanings of the feedback step by step (Fig 8);

FIG 8

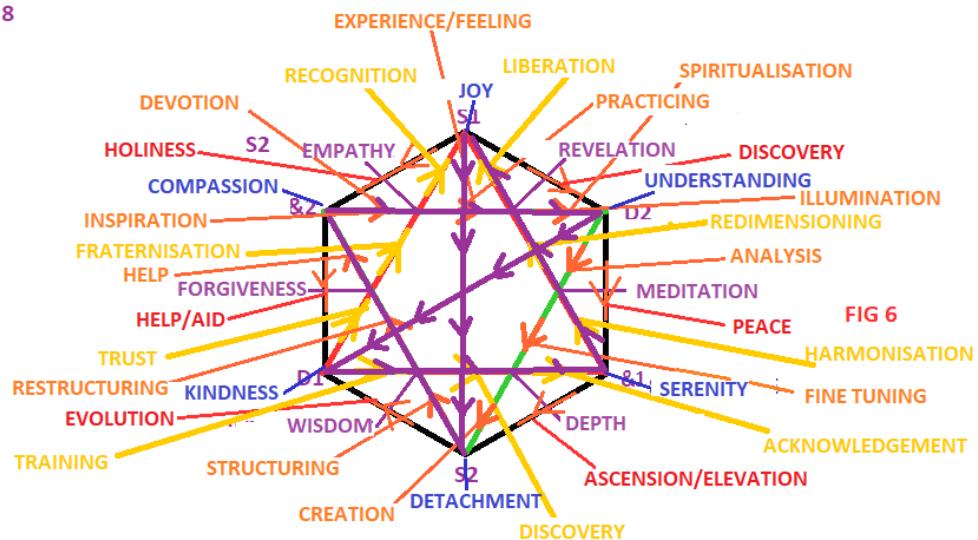

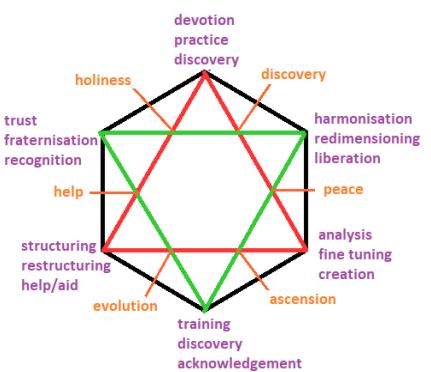

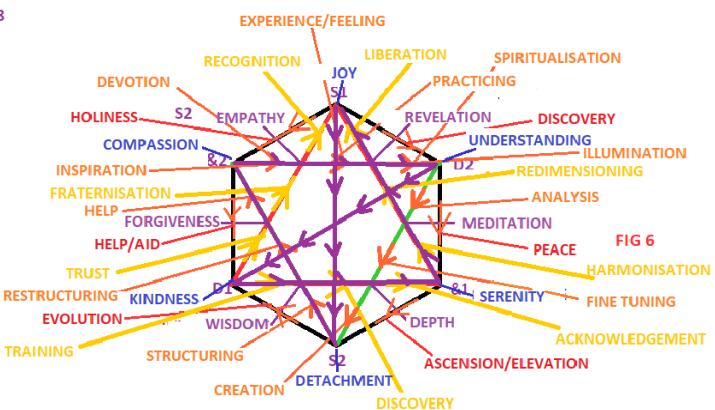

FIG 6

-step 9 complementary refinement, the two feedbacks are broken down into two complementary triangles with the red one and the green one, but which exchange contents between the tips and the edges (Fig. 9);

FIG 8

-step 10 is resumed from step 7 by completing the vectors and refining the concepts into a granulation refinement, which will correspond to the moving to the next layer in the coherent information space. Next step 10 resumes step 5, semifeedbacks;

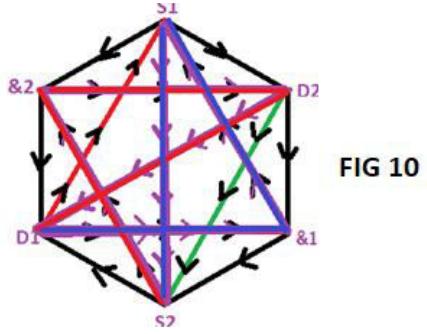

FIG 10

This time each of the three segments of a semifeedback can be transferred from the point of view of the contents in the source, sensor, decider, for one of the two initial triangles green or red, in figure 1.

This procedure leads to a polarization of information that can by subsequent refinement lead to a greater conceptual refinement and understanding of its evolution (reference to semicycles).

Informational semicycles have their own rhythms of semantic development, which is why separate development stages occur at each semicycle. These separate stages are integrated into cycles. This explains the historical leaps in which one component grows faster and pulls another that grows slower.

Example

COLUMN 5 - ROW 6 developing primitive societies and initiating commercial trade

LOGIC	PLACE/MOMENT	LOGIC	LOGIC	Processing the purchasing logic of market responses and product presentation that will help make markets more efficient , disciplining the markets so that they do not increase needs beyond the nature of supplying resources and not paralyze recuperative and balanced actions of nature through pollution of any kind

The processing of semantic information packets, in the specific language, including the human language, is done using the initiatory paths. These can be few or many, joining two points and traveling the path in one way, from point A to point B. However, these routes are always logical and coherent.

All these programs can be treated coherently together by the same technique of thinking and processing data derived from the analysis of the circulating information and the feedbacks on several levels, projected over the structures of the nodes of the semantic networks.
